

AcmeTelco × Voltade — Demo Sandbox

A live preview of **AcmeBot**, an AI customer-care agent built for AcmeTelco's consumer flows (mobile, fibre, TV, roaming, billing), on Voltade's agent-native helpdesk platform.

1. OPEN + SIGN IN

Go to `demo-telco.voltade.app`, enter your `@acmetelco.com` email, paste the 6-digit OTP from your inbox. Only `@acmetelco.com` and `@voltade.com` addresses allowed.

1. ADD YOURSELF AS A TESTER — TWO WAYS

(a) Web chat — fastest, no setup. Open `demo-telco.voltade.app/test-web` and start typing. The widget posts straight to the same agent your inbox sees.

(b) WhatsApp — the real production channel.

1. From the dashboard go to **Channels** → click **Connect platform sandbox** to claim a shared Voltade WhatsApp number from our test pool.
2. A panel appears with a QR + a one-line command like `/link b6e2d419c70a`. Scan the QR with your phone's WhatsApp — it opens the sandbox chat with the link command pre-filled. Send it.
3. Your phone is now a tester. Send any normal message ("hi, what's my data plan billed at this month?") and watch it land in **Inbox** as a real conversation. AcmeBot replies back on WhatsApp.

1. SUGGESTED PROMPTS

- *"What's the cheapest data plan with at least 50GB?"*
- *"Bali roaming charged me \$89 even though I activated the roaming add-on — credit?"*
- *"My fibre at 048660 has been down since 8am — anything you can see?"*

1. WHAT'S PRE-LOADED

6 seeded conversations (family plan, SME fibre, roaming dispute, prepaid port, TV bundle, 5G roaming) · AcmeBot knowledge base (`BUSINESS.md` , pricing, ETF, PDPA) · 3 staff teammates

with escalation rules (Alex / Sam / Jamie) · Live activity feed of every wake, tool call, and internal note.

1. TWO THINGS WORTH NOTICING

ADAPTIVE SOFTWARE

Same codebase as every Voltade tenant — agent voice, knowledge base, pricing, escalation rules, and staff roster are all **config + seed**, not code. We reshaped this demo into AcmeTelco in hours. Your real deployment edits the same files.

SELF-LEARNING

AcmeBot writes lessons to its own memory after every conversation. Staff coach it via `@`-mention internal notes — next reply applies the rule. Per-customer + per-staff memory persists across threads. Sharper with use, no retraining.
